产品符合：IEC60947-1:2007//IEC60947-5-1:2003//IEC61000// Q/320217DCG01-2008标准

GMR-32B series is a new electrical source protection relay using micro-control electric circuit. Under 500V, it can protect the motor or other equipment when phase reverse happens before starting and dynamic/static phase loss, over/under-volt and phase imbalance happens during operating. The protecting function can't be affected by load current, load characteristics, circuit and asymmetry. The product has the features of protection precise, fault indication definite, fault judgment accurate and operating voltage scale wide etc. The product can long term stable work in the very bad environment (such as temperature, humidity, the electromagnetism disturbance).

Overview

3-phase network control relays monitor:

- The correct sequence of phases L1, L2, L3
- Total phase loss
- Undervoltage and overvoltage from 10 to 15 % of Un
- Asymmetry rate from 5 to 15 % of Un
- LEDs are used for fault signalling.

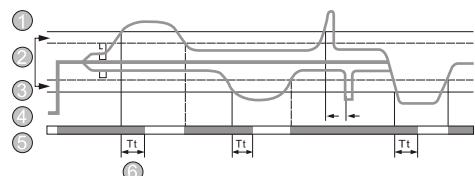

If a fault persists for longer than the threshold crossing delay configured by the user, the output relay opens and the LED is extinguished.

Operating principle

SMR: Phase controller with voltage regeneration +Asymmetry + Under/Ovvoltage Voltage selector switch:

Set the selector switch to the 3-phase network voltage Un.

The position of this selector switch is only taken into account when the unit is powered up. If the switch position changes while the unit is operating, all the LEDs flash but the product continues to work normally with the voltage selected on energisation prior to the change of position.

The LEDs return to their normal state if the switch is reset to its initial position defined before the last energisation.

The relay monitors its own supply voltage.

The relay controls:

- correct sequencing of the three phases
- failure of one of the three phases (U measured $< 0.7 \times Un$),
- asymmetry, adjustable from 5 to 15 % of Un,
- and the under and over voltage drift adjustable from 10 to 15 % of Un (-7 to -12% across the 3 x 208 V range, -2 to -17% across the 3 x 220 V range due to the minimum voltage 183 V; +2 to +10 % across the 3 x 480 V range due to the maximum voltage 528 V).

In the event of a phase sequence or failure fault, the relay opens instantaneously.

In the event of an asymmetry or voltage fault, the relay opens at the end of the time delay set by the user.

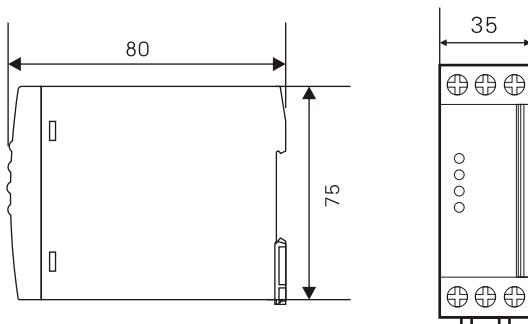

When the unit is powered up with a measured fault, the relay stays open.

Asymmetry is defined as follows: $(V_{rms\ max.} - V_{rms\ min.}) / V_{rms\ mains}$.

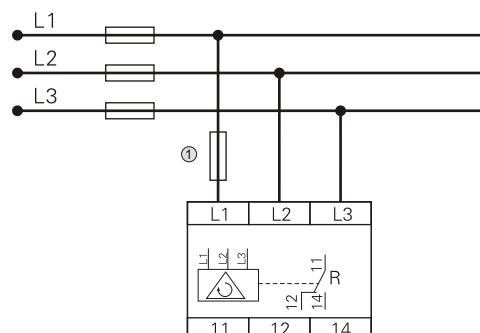

$V_{rms\ mains}$ corresponds to the voltage selected by the switch on the front face.

- ② Hysteresis
- ③ Undervoltage
- ④ Phases L1, L2, L3
