Catalog

1 Overview

The ARD3M intelligent motor protector (hereinafter referred to as the protector) is suitable for low-voltage motor circuits with rated voltage up to 660V and integrates protection, measurement, control, communication, operation and maintenance.Its perfect protection function ensures the safe operation of the motor, with logic programmable function, can meet a variety of control methods.Different communication modules can be selected to meet the needs of field communication.

Product Implementation standards:

——GB 14048.4-2020 Low-voltage switchgear and controlgear -- Part 4-1: Contactors and motor starters -- Electromechanical contactors and motor starters (including motor protectors);
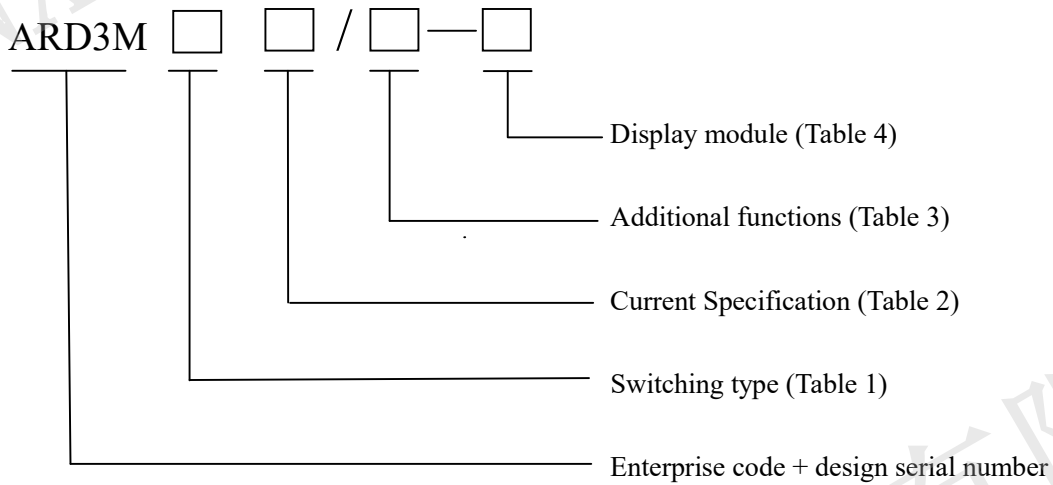

——JBT 10736-2007 Low voltage motor protector.

2 Product Features

■   The auxiliary power type is optional. The AC220V power module supports the power range of AC85-265V/DC100-300V and the AC380V power module supports the power range of AC/DC100-415V.

■   Support fundamental and full-wave power parameter measurement (U, I, P, Q, S, PF, F, EP, EQ), voltage and current imbalance degree, voltage and current positive sequence, negative sequence, zero sequence component, three-phase voltage phase angle, residual current, voltage and current 2-63 sub-harmonic measurement, sub-harmonic inclusion rate and total harmonic distortion rate.

■   Protection functions include overload inverse time, overload definite time, grounding, starting a timeout, leakage, under load, locked-rotor, obstruction, short circuit, phase, overflow, imbalance (current, voltage, power, less power, overvoltage, undervoltage, phase sequence, temperature, time, external fault, tE starting number, running time, alarm, fault alarm.

■   10 channels programmable DI input, the default use of DC24V power supply, or external active wet contact can be selected (see the selection table).

■   6 channels programmable DO output, to meet the direct starting, Y-△ starting, auto-transformer starting, and other starting modes, can be through the communication bus to achieve the master station to the motor remote control "start/stop".

■   Optional anti-shaking function: support immediate restart of shaking power and restart of voltage loss.

■   2 MODBUS_RTU communication channels are standard, and PROFIBUS DPV1, Ethernet and Profinet communication modules are available for selection.

■   Optional 2 channels DC4-20mA analog output interface, connected with DCS system, can realize the monitoring of field equipment.

■   With fault record, start record, stop record, DI displacement record, restart record and other records of various events, you can view a number of motor operation and maintenance information, and can record the motor operation record for 1-5 hours at the same time.

■   The display interface supports Chinese/English liquid crystal display

■   It supports exporting waveform record and event record data on usb flash disk, and can open exporting event record file with EXCEL。

■ WIFI function can be added when color LCD is optional, and relevant data of motor protector can be viewed and set by connecting the WIFI via mobile phone or computer.

3、Model Description

ARD3M □ □ / □ — □

- Display module (Table 4)
- Additional functions (Table 3)
- Current Specification (Table 2)
- Switching type (Table 1)
- Enterprise code + design serial number

The standard switch quantity of ARD3M is 10DI and 6DO, and the switch quantity type is shown in Table 1:

Table 1

Main switch classification	Code
DI is the dry contact, and the external power supply of DO is AC220V	K1
DI is the wet contact, the input is DC110V, and the external power supply of DO is AC220V	K2
DI is the wet contact, the input is DC220V, and the external power supply of DO is AC220V	K3
DI is the wet contact, AC220V input, and DO external power supply is AC220V	K4

The correspond to relation between ARD3M current specification and the rated current and power of the applicable motor is shown in Table 2:

Table 2

Protector current specification (A)	Ratio setting	Primary side coil number of transformer	Applicable scope of motor (kW)	Suitable for motor Rated current range (A)
1	Support	5 circle	0.12-999	0.1-5000
5		1circle	0.12-999	0.5-5000
25	Does not support	1circle	3-11	6.3-25
100		1circle	15-45	25-100
250		1circle	55-132	63-250
800		1circle	160-250	250-800

Additional features of ARD3M are shown in Table 3:

Table 3

Additional function		Code	Additional function	Code
2-63 harmonic voltages and currents		H	Waveform recording	WR
Additional Communication module (Optional)	1channel PROFIBUS DPV1communication	CP	Anti - electric shock function	SU
	2 channel PROFIBUS DPV1communication	2CP	Insulation monitoring	Ri
	Ethernet communication (MODBUS TCP protocol)	MCE	Electric leakage protection	L
	1channel Profinet communication	PNET	Fault record	SR
1channel 4-20mA output		M1	2 channel 4-20mA output	M2
Wireless function (optional with color dot matrix LIQUID crystal)		WIFI		

See Table 4 for the ARD3M display module:

Table 4

Display module	code
Black and white dot matrix LCD, module size 98×60, opening 92×55 (unit mm)	60L1
Color dot matrix LCD, module size 98×60，cut-out 92×55（Unit mm）	60L2

Remarks:

（1）The auxiliary power supply defaults to AC 220V. If AC 380V auxiliary power is needed, please note the correspond to parameters when placing an order after communication with the manufacturer.

（2）The current specifications of 100A and below shall be the same type of current transformer. The transformer is equipped with a secondary line of about 1m. If you need special line length, please contact the manufacturer.The 250A and 800A current specifications use two other types of transformers with no secondary wires.See "External Dimensions and Installation" for the dimensions of the transformer

（3）The standard display cable is a network cable with a length of 1.5m. 3 meters and 5 meters are available for optional configuration. You can place an order and remark the correspond to cable length.

（4）For customers who do not need display modules, a batch of optional several display modules can be used as a programmer, or the configuration software provided by the manufacturer can be used to configure parameters through computer software.

（5）The temperature measurement support sensor type is PTC or NTC.

（6）After selecting the leakage function (L), each protector shall be equipped with a leakage transformer. Please refer to the "External Dimensions and Installation" section for the dimensions of the leakage transformer.The leakage transformer is equipped with a secondary wire of 2m±10cm. If other lengths are needed, please contact the manufacturer.

4 Main parameters

4.1 Technical indicators

ARD3M technical indicators are shown in Table 5:

Table 5

Technical parameters	Technical indicators	
Protector auxiliary power supply	Support two power modules, AC 220V power module (AC85-265V/DC100-300V) default, AC 380V power module (AC/DC 100-415V) optional	
Rated working voltage of the motor	AC220V／380V／660V，50Hz／60Hz	
Rated operating current of the motor	1 (0.1A-5000A)	External current transformer
	5 (0.1A-5000A)	
	25（6.3A-25A）	
	100（25A-100A）	
	250（63A-250A）	
	800（250A-800A）	
Relay output contact capacity	Impedance load	AC250V、10A
Switching input	10 channels of passive dry contact (active DC110V, DC220V, AC220V input can be optional)	
Communication	Standard supplied	2channel MODBUS RTU communication
	Optional（only one can be selected）	1-2 channel PROFIBUS DPV1communication、1channel PROFINET communication、Ethernet communication（MODBUS TCP protocol）
Environment	Working temperature	-10ºC～55ºC
	Storage temperature	-25ºC～70ºC
	Relative humidity	≤95％No condensation, no corrosive gas
	Altitude	≤2000m
Pollution levels	Class 3	
Protection grade	Main body IP20, split display module IP54 (installed on the cabinet panel)	
Installation category	Level III	

4.2 Functional configuration

The ARD3M functional configuration is shown in Table 6

Table 6

Function	Type	Functional configuration	
		Standard function	Optional function
Protection function	Fixed time overload	√	
	Inverse time overload	√	
	Starting timeout	√

5 Overall dimensions and installation

The product composition of ARD3M is shown in Figure 1, Figure 2 and Figure
FIG. 1 Composition of products with 100A and below specifications
FIG. 2 Composition of 250A and 800A
FIG. 3 Assembly diagram of main body and optional communication module

Note: When a single channel PROFIBUS_DP, Ethernet or PROFINET communication module is selected, its combination with the main body is the same as that shown in Figure 3.

5.1 Panel size and opening（Unit:mm）

5.1.1 60L1 The shape and opening size of the black and white LIQUID crystal panel are shown in Figure 4:

Front view   Side view   Back view
Disk cut-out size

Figure 4 60L1 shows the unit shape and hole size

5.1.2 The external dimensions of 60L2 color LIQUID crystal panel are shown in Figure 5 (the dimensions of side view, rear view and opening are the same as those of 60L1 black and white liquid crystal panel) :
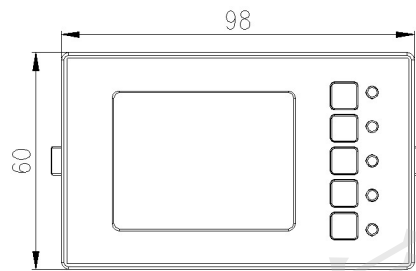

Figure 5 60L2 shows the external dimensions of the unit

5.2 Size of main and additional Communication module (unit: mm)

5.2.1 The ARD3M main body is installed with 35mm guide rail, and its external dimensions are shown in Figure 6:
Front view   Side view

Figure 6 ARD3M main body dimensions

5.2.2 The external dimensions of PROFINET communication module, single-channel PROFIBUS_DP communication module and Ethernet communication module are shown in Figure 7. Each communication module is installed with guide rail:
Front view   Side View

Figure 7 Overall dimensions of PROFINET, single-channel PROFIBUS_DP
and Ethernet communication module

5.2.3 The size of the dual-channel PROFIBUS_DP communication module is shown in Figure 8.
The module is installed with guide rail:
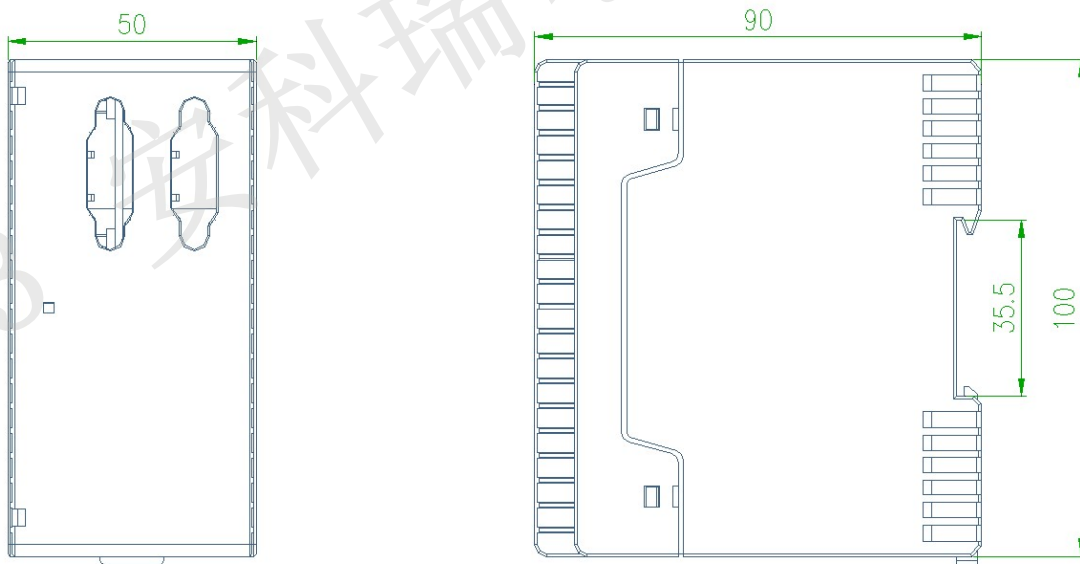

Front view   Side View

Figure 8 External dimensions of 2-channel PROFIBUS_DP communication module

5.3 Transformer size

5.3.1 The external dimensions of current transformers of 100A and the following specifications
are shown in FIG. 9 (unit: mm) ::

The current transformer with the current specification of the protector is 100A, with the standard
secondary connection line length of 1m±10cm. If other lengths are needed, please contact the

manufacturer, for example, 3m and 5m lines are optional.The secondary lines of yellow, blue, red and black correspond to to the correlation of current A, B, C and the common end of the transformer. A protector is equipped with A set of transformer.
FIG. 9 External dimensions of current transformers with specifications below 100A

5.3.2 The external dimensions of the 250A current transformer are shown in FIG. 10 (unit: mm) :
The current specification of the protector is the current transformer matched at 250A. There is no secondary connection wire. One protector is equipped with three transformers.
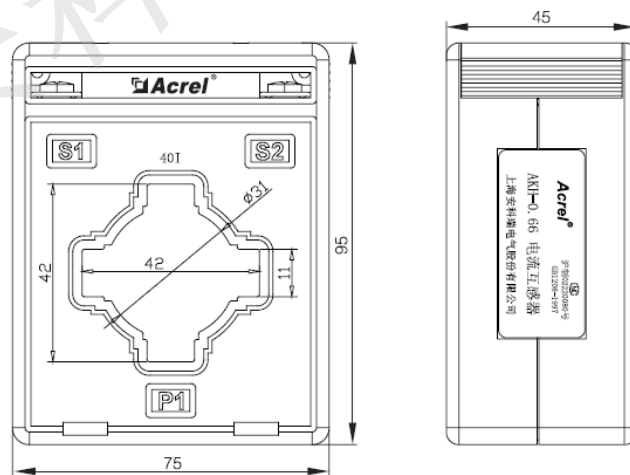

FIG. 10 External dimensions of current transformer 250A

5.3.3 The external dimensions of the current transformer (800A) are shown in FIG. 11 (unit: mm) :

The current specification of the protector is 800A and the current transformer is not equipped with secondary connection. One protector is equipped with three transformers.
FIG. 11 External dimensions of current transformer 800A

5.3.4 The external dimensions of the leakage current transformer are shown in Figure 12 and Table 7 (unit: mm) :

The protectors with current specifications of 100A and below are equipped with leakage current transformers with specifications of L-45.250A and current protector with specifications

L-80 leakage current transformer;800A and current specification protector with L-150 leakage current transformer.The leakage transformer is equipped with a secondary wire of 2m±10cm. If other lengths are needed, please contact the manufacturer.
FIG. 12 External dimensions of leakage current transformer

Table 7

Type Spec	Overall size(mm)			Go through size(mm)	Installation size(mm)			Tolerance(mm)	Weight （g）
	W	H	D	Φ	M	N	Φ2		
L-45	75	75	22	46	65	65	4		200±10
L-80	120	120	23	81	105	105	4	±1	380±20
L-150	196	205	24	150	175	180	6		850±50

5.4 Terminal

The wiring terminal arrangement of the ARD3M main body is shown in Figure 13:
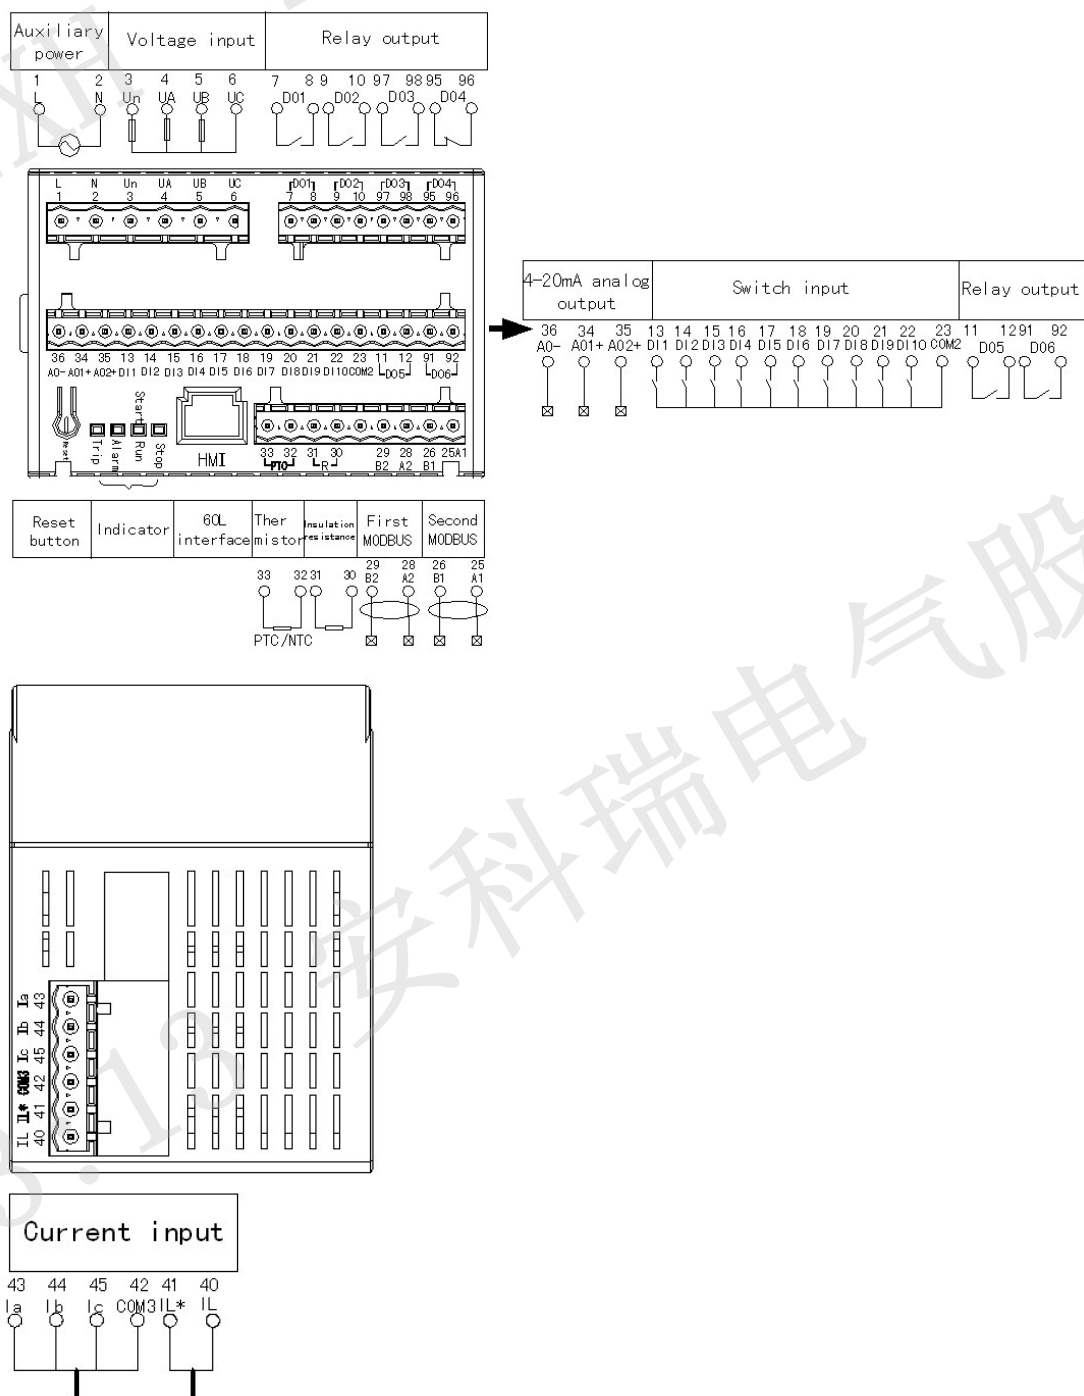

FIG. 13 ARD3M terminal arrangement

Table 8 shows the ARD3M terminal number and function definition:

Table 8

Terminals no.	Function definition	Remark
1	Power input L (+ at DC time)	The auxiliary power supply is connected to the two terminals
2	Power input N (- at DC time)	
3	Un input	Three-phase voltage input
4	Ua Phase voltage input	

5	Ub Phase voltage input	
6	Uc Phase voltage input	
7、8	DO1，Start 1 output	6-channel programmable relay output (DO) (The function is defined as factory default setting, which can be set by users according to their needs)
9、10	DO2，Start 2 output	
97、98	DO3，Trip output, normally open point signal	
95、96	DO4，Trip output, normally closed signal	
11、12	DO5，Circuit breaker output	
91、92	DO6，Alarm output	
13	DI1，Start 1 signal input	10-channel programmable Switching input (DI) (The function is defined as factory default setting, which can be set by users according to their needs)
14	DI2，Start 2 signal input	
15	DI3，Stop signal input	
16	DI4，Reset signal input	
17	DI5，Emergency stop signal input	
18	DI6，External fault signal input	
19	DI7，Control permission 1 input

43	Ia Phase current input	
44	Ib Phase current input	
45	Ic Phase current input	

6 Protection function description

The default action stages of each protection are shown in Table 9:

Table 9

Protection type	Default active period

Overvoltage,undervoltage,voltage imbalance,phase sequence,external fault,overflow protection,starting times,fault times,running time,PTC/NTC temperature protection,insulation monitoring	whole course
Reverse time overload,blocking, phase break,leakage,grounding,starting timeout,short circuit,overflow protection,Overvoltage,undervoltage,voltage imbalance,phase sequence,external fault,number of starts,number of faults,running time,PTC/NTC temperature protection,fixed time overload,insulation monitoring	When starting
Reverse time-limit overload,blocking, phase break,current imbalance,leakage,grounding,constant time-limit overload,under load,short circuit,overflow protection,overvoltage,undervoltage,voltage unbalance,phase sequence,underpower,overpower,external fault,PTC/NTC temperature protection,number of starts,number of faults,running time,insulation monitoring	In operation

6.1 Inverse time overload protection

When the motor runs for a long time in excess of its rated current under excessive load, it will overheat the motor, reduce insulation and burn it out. The protector calculates the heat capacity of the motor according to its heating characteristics and simulates its heating characteristics to protect the motor.

The starting condition of reverse time-limit overload protection is that the maximum three-phase current reaches the set overload starting value, and the default overload starting value is 1.2 times the motor's rated current.

The current-time comparison table of overload protection is shown in Table 10, and the overload characteristic curve (K curve) is shown in Figure 14:

Table 10

Optional tripping curve grade K	1	2	3	5	10	15	20	25	30	35	40
Tripping delay（S）tolerance ±10%	Three - phase balanced load, starting from the cold state										
Rated value Ie×1.2	25	50	75	125	250	375	500	625	750	875	1000
×1.5	16	32	48	80	160	240	320	400	480	560	640
×2	9	18	27	45	90	135	180	225	270	315	360
×3	4	8	12	20	40	60	80	100	120	140	160
×4	2.26	4.52	6.78	11.3	22.5	33.8	45	56.3	67.5	78.8	90

×7.2	0.7	1.4	2.1	3.5	6.9	10.4	13.9	17.4	20.8	24.3	27.8
FIG. 14 Characteristic curve of overload (K curve)

Inverse time overload protection improves manual and automatic reset options.When "automatic" is selected, after the overload trip of the motor, the heat capacity will be automatically reset to less than 15%, and the restart operation can be allowed without the need for further reset operation;When "manual" is selected, after the motor overload trip, the heat capacity will be reduced to less than 15%. Manual manual reset is required, otherwise the restart operation is not allowed.
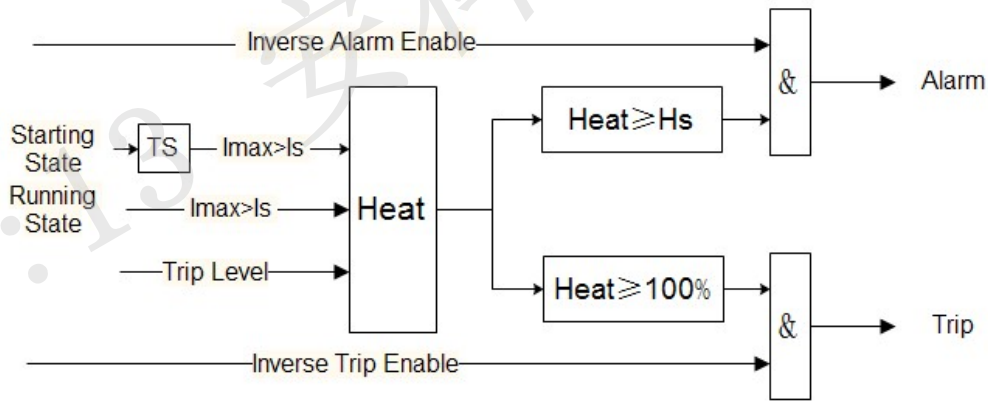

Note:

Imax:Maximum three-phase current

In:Rated current

Heat:Percentage heat capacity

Hs:Heat capacity alarm value

6.2 Start overtime protection

When the starting time of the motor reaches the starting time set by the user, the average three-phase current does not drop below the set tripping threshold, trigger the starting timeout protection, issue tripping command, and stop the motor operation.For the increased safety motor, the starting time setting shall not exceed 1.7 times tE time.
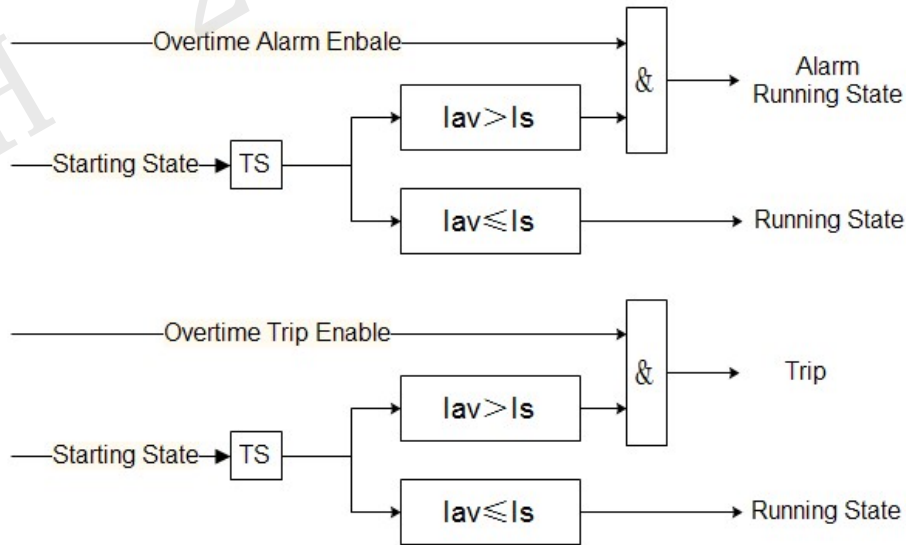

Note:

Iav:Three-phase mean current

Is:Set trip threshold

Ts:Starting time

6.3 Locked-rotor protection

In the process of starting, if the motor shaft is stuck due to excessive load or mechanical reasons, and the fault is not removed in time, the motor will overheat and the insulation will be reduced and the motor will be burned out.The locked-rotor protection is applicable to the motor when such faults occur in the starting stage. When the average current percentage reaches the set threshold, the protector will trip or alarm within the set time in time to avoid the motor burning out.
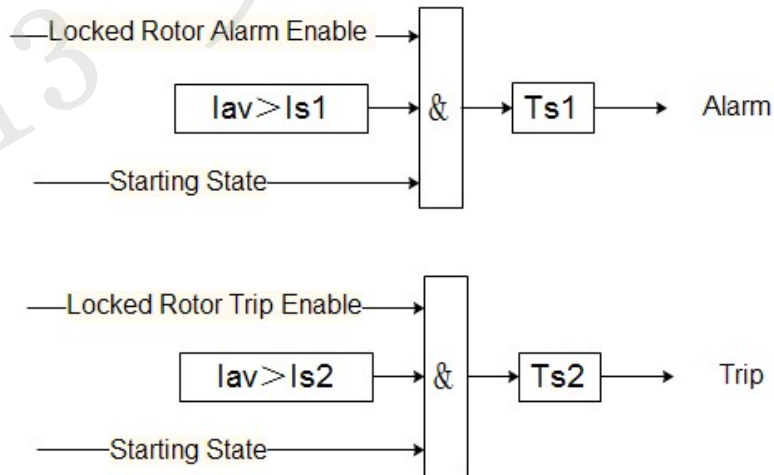

Note:

Iav:Three-phase mean current

Is1:Alarm action threshold

Is2:Tripping threshold

Ts1:Alarm action delay time

Ts2:Delay time of trip action

6.4 Blocking protection

During the operation of the motor, if the motor shaft is stuck due to excessive load or mechanical reasons, and the fault is not removed in time, the motor will be overheated and the insulation will be reduced and the motor will be burned out. The blocking protection is applicable to protect the motor when such faults occur in the running stage. When the average current reaches the set threshold, the protector will trip or alarm within the set time in time to avoid the motor burning out。
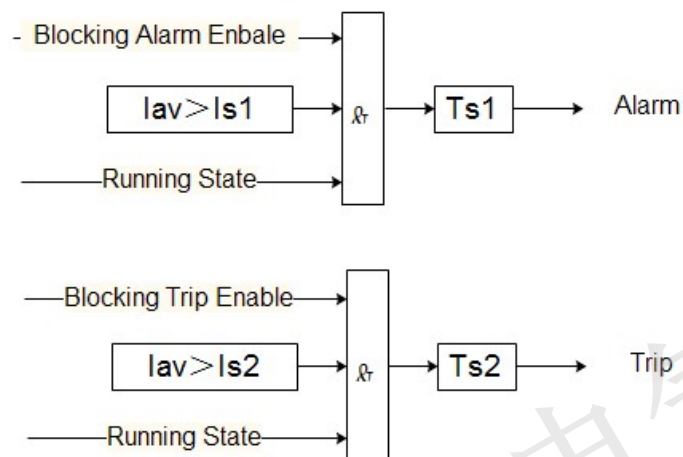

Note:

Iav:Three-phase mean current

Is1:Alarm action threshold

Is2:Tripping threshold

Ts:Alarm action delay time

6.5 under load protection

The protector provides under load protection when the motor is loaded with pumping load. When the average three-phase current is lower than the set value, the protector should trip or alarm within the set time.
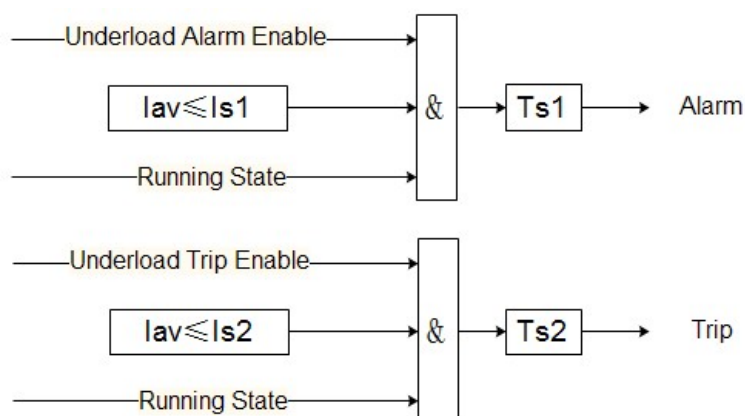

Note:

Iav: Three-phase mean current

Is1: Alarm action threshold

Is2: Tripping threshold

Ts1: Delay time of alarm action

Ts2: Delay time of trip action

6.6、Underpower protection

When the load power is lower than the set action value, the protector will trip or alarm during the set action time.
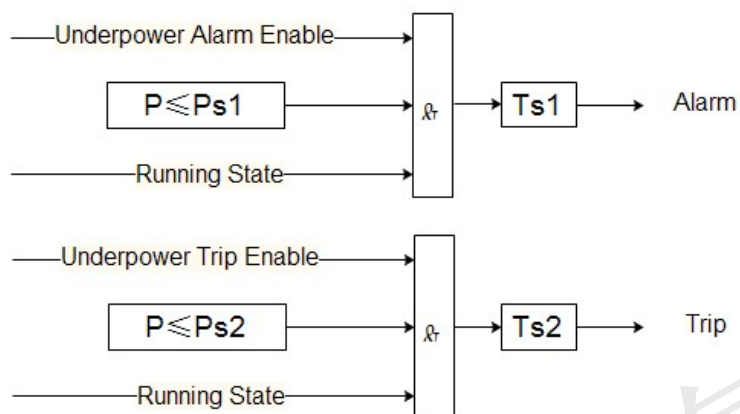

Note:

P: Total active power

Ps1: Alarm action threshold

Ps2: Trip action threshold

Ts1: Delay time of alarm action

Ts2: Delay time of trip action

6.7 Overload protection

In addition to reverse Overload protection, the protector can also provide time-limit overload protection. When the percentage of three-phase average current and rated current is greater than the set value, the protector should trip or alarm within the set time.
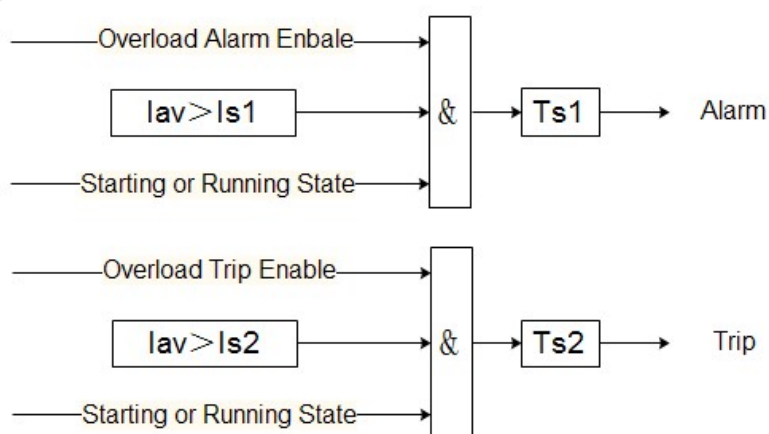

Note:

Iav: Three-phase mean current

Is1: Alarm action threshold

Is2: Tripping threshold

Ts1: Delay time of alarm action

Ts2: Delay time of trip action

6.8 Overpower protection

When the percentage of load power to rated power is greater than the set action value, the protector will trip or alarm during the set action time.
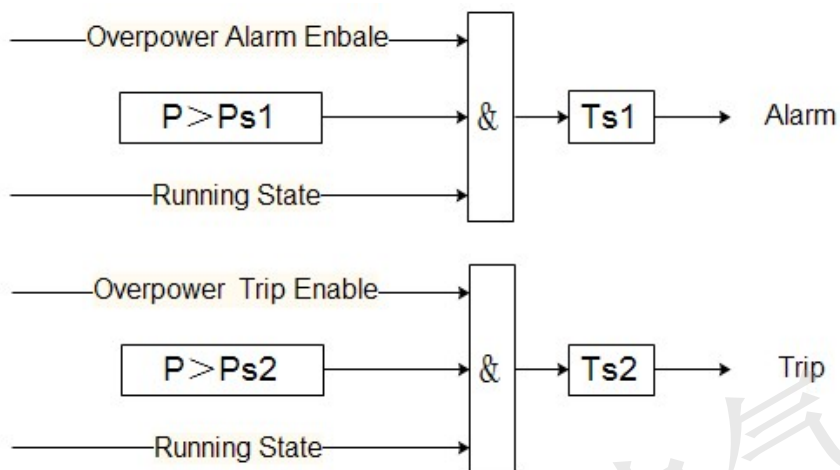

Note:

P: Total active power

Ps1: Alarm action threshold

Ps2: Trip action threshold

Ts1: Delay time of alarm action

Ts2: Delay time of trip action

6.9 Ground fault protection

The protector is protected by the ground current according to the three-phase current vector and the calculation of the ground current.The grounding protection can set the starting shielding time. After the starting shielding time, when the grounding current is greater than the set value, the action logic can choose the breaker or breaker or alarm. When the breaker is chosen, the protector should first switch the breaker and then switch the contactor after 200ms
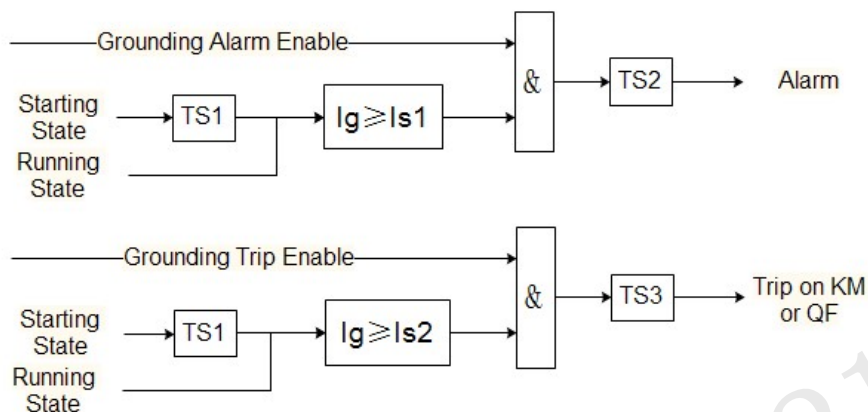

Note:

Ig: Ground current

Is1: Alarm action threshold

Is2: Tripping threshold

Ts1: grounding start shielding time

Ts2: Delay time of alarm action

Ts3: Delay time of trip action

6.10 Leakage protection

Leakage protection should be equipped with leakage current transformer, which can detect the leakage current through the zero-sequence transformer.The leakage protection can set the starting shielding time. After the starting shielding time, when the leakage current is greater than the set value, the operation logic can choose the breaker or breaker or alarm. When the breaker is chosen, the protector should first switch the breaker and then the breaker after 200ms.
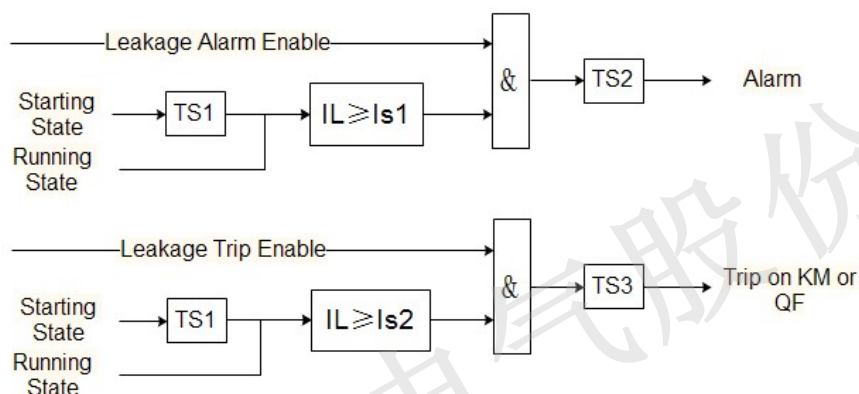

Note:

IL: Leakage current

Is1: Alarm action threshold

Is2: Tripping threshold

Ts1: Shield time for leakage starting

Ts2: Delay time of alarm action

Ts3: Delay time of trip action

6.11 I unbalance protection

The protector calculates the current imbalance degree. When the three-phase current imbalance degree is greater than the set value, it will trip or alarm within the set time.The calculation formula of current imbalance degree is as follows:

$$Iuf = \left| \frac{Imax(min) - Iav}{Iav} \right| \times 100\%$$

Iuf is the current imbalance, Imax is the maximum current, Imin is the minimum current, and Iav is the average current.
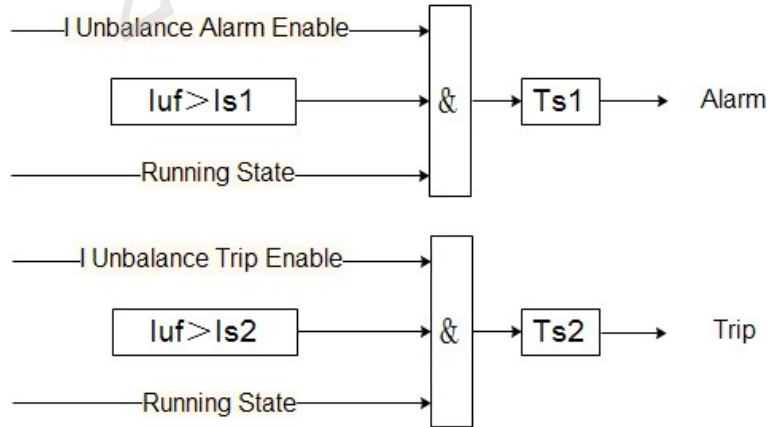

Note:

Iuf: Degree of current imbalance

Is1: Alarm action threshold

Is2: Tripping threshold

Ts1: Delay time of alarm action

Ts2: Delay time of trip action

6.12 U unbalance protection

The protector calculates the voltage unbalance. When the voltage unbalance is greater than the set value, it will trip or alarm within the set time.The calculation formula of voltage imbalance is as follows:

$$Uuf = \left| \frac{Umax(min) - Uav}{Uav} \right| \times 100\%$$

Uuf is the voltage imbalance, Umax is the maximum line voltage, Umin is the minimum line voltage, and Uav is the average line voltage.
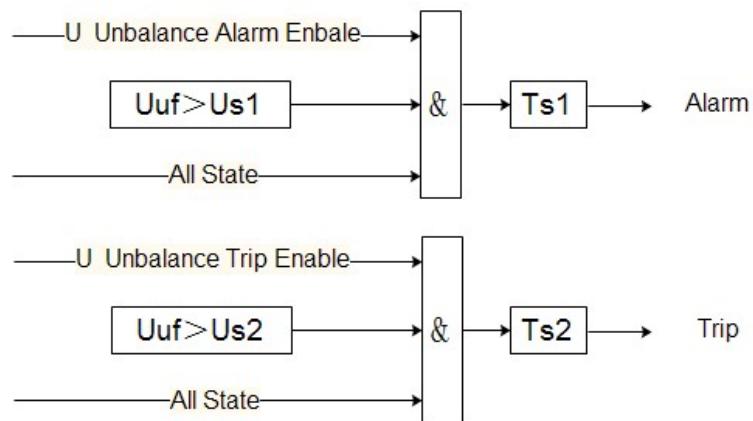

Note:

Uuf: Voltage imbalance degree

Us1: Alarm action threshold

Us2: Trip action threshold

Ts1: Delay time of alarm action

Ts2: Delay time of trip action

6.13 Phase fail protection

When the phase fault runs, it will do great harm to the motor. When the maximum current is greater than 20% rated current and the minimum current is less than 5% rated current, or when the imbalance degree of three-phase current is greater than 30%, the fault protection will trip or alarm within the set time.
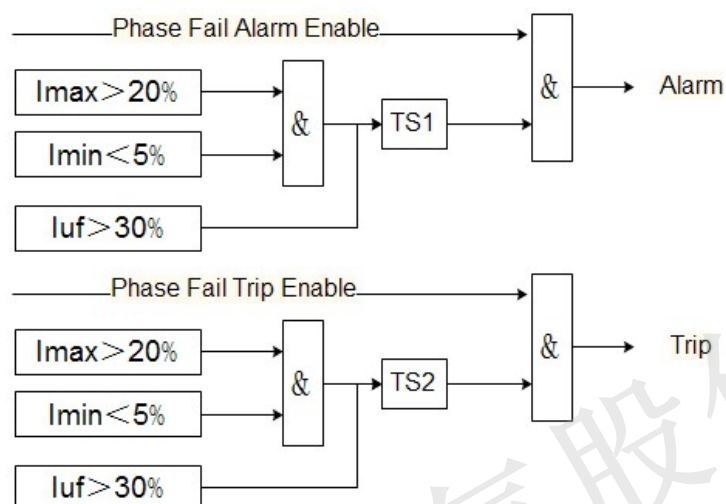

Note:

Imax: Maximum current

Imin: Minimum current

Iuf: Degree of current imbalance

Ts1: Delay time of alarm action

Ts2: Delay time of trip action

6.14 Phase sequence protection

When the error of three-phase voltage phase sequence is detected, the protector will trip or alarm within the set time to protect the safety of the motor.
Note:

Angle: The Angle between any two - phase voltage

Ts1: Delay time of alarm action

Ts2: Delay time of trip action

6.15 Overvoltage protection

Excessive voltage will cause damage to the insulation of the motor. When the maximum line voltage of the motor exceeds the set value, the protector will trip or alarm within the set time.
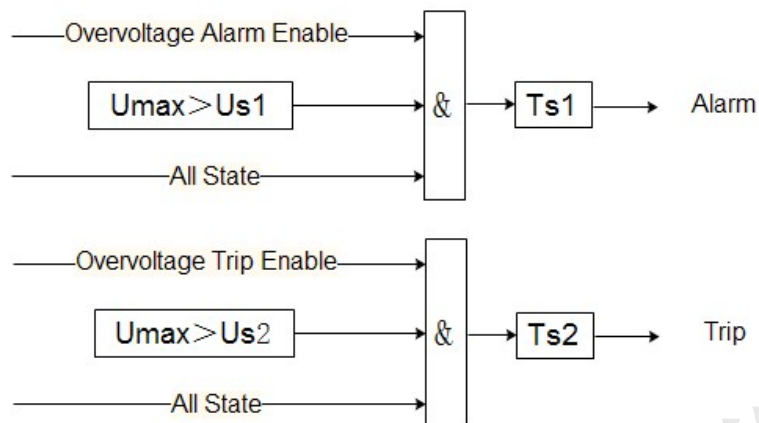

Note:

Umax: Maximum line voltage

Us1: Alarm action threshold

Us2: Trip action threshold

Ts1: Delay time of alarm action

Ts2: Delay time of trip action

6.16 Undervoltage protection

Too low voltage will cause the motor to slow down, or even stop running.When the minimum line voltage of the motor is lower than the set value, the protector will trip or alarm within the set time.
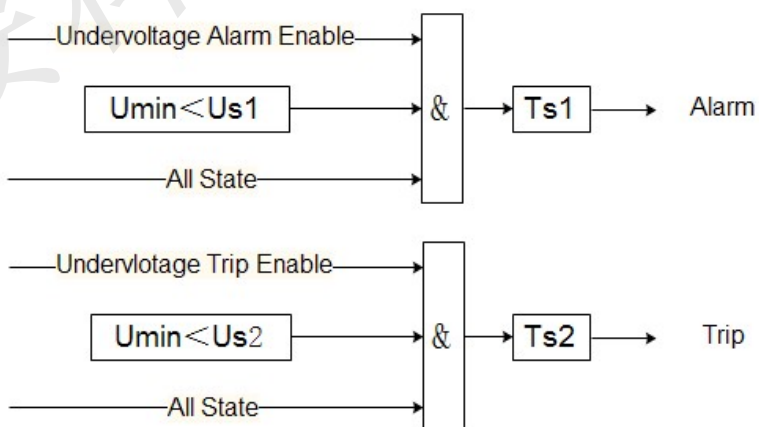

Note:

Umin: Minimum line voltage

Us1: Alarm action threshold

Us2: Trip action threshold

Ts1: Delay time of alarm action

Ts2: Delay time of trip action

6.17 Short circuit protection

When the motor current exceeds the set value, the protector will switch circuit breaker or alarm within the set time.The short circuit protection is divided into two stages: starting and running. The protection parameters of the two stages can be set independently.
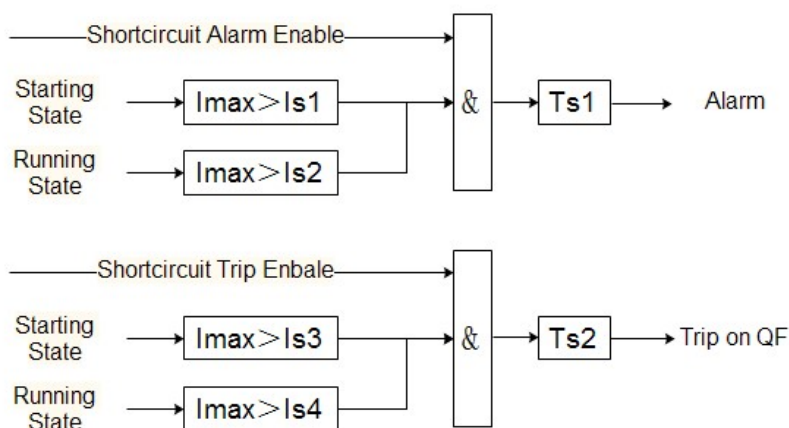

Note:

Imax: Maximum current

Is1: Threshold of short circuit alarm during starting stage

Is2: Threshold of short circuit alarm during operation

Is3: Threshold of short-circuit trip during starting stage

Is4: Threshold of short-circuit trip during operation

Ts1: Delay time of alarm action

Ts2: Delay time of trip action

6.18 Temperature protection

Temperature protection is based on the thermistor resistance embedded in the stator windings or bearings of the motor.According to the type of thermistor selected, the protection logic is different: when the thermistor is PTC, when the detected resistance value is greater than the set value, the protector will trip or alarm within the set time;When the thermistor is NTC, when the detected resistance value is less than the set value, the protector will trip or alarm within the set time
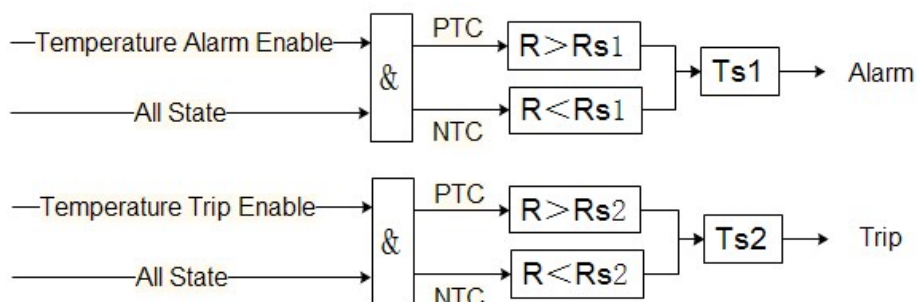

Note:

R: Check the temperature resistance

Rs1: Alarm action temperature resistance value

Rs2: Resistance value of tripping action temperature

Ts1: Delay time of alarm action

Ts2: Delay time of trip action

The temperature protection can be reset manually or automatically.When "Automatic" is selected, the protector will reset automatically after the temperature protection trip when the resistance value is detected to be less than the set return resistance value.When "manual" is selected, after the temperature protection trip, if the resistance value is detected to be less than the set return resistance value, manual manual reset is required, otherwise it will not be allowed to start again.

6.19 External fault

When the input of switch quantity defined as external fault is set as "normally on", the closing signal is taken as the trigger condition of the fault. When the duration of the fault signal is longer than the set tripping/alarm delay time, tripping/alarm will be generated.When the input of switch quantity defined as external fault is set as "normally closed", the disconnect signal is used as the trigger condition of the fault. When the duration of the fault signal is longer than the set trip/alarm delay time, trip/alarm will be generated.
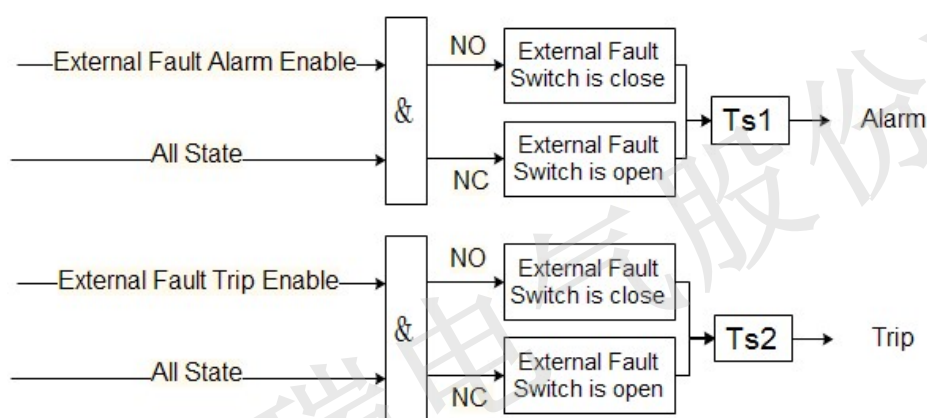

Note:

Ts1: Delay time of alarm action

Ts2: Delay time of trip action

6.20 Overflow protection

When the fault occurs, the current exceeds the breaking current of the contactor, and the contactor will be damaged if the contactor is forcibly disconnected.At this point, the breaker should be broken first, and then disconnect the contactor after the fault current is removed.

If the fault current of the protector is greater than the set overflow current before any other tripping fault action, the breaker should be first switched on, and then the contactor should be switched off after 200ms.
Note:

Imax: Maximum current

Is1: Overflow current

6.21 Number of starts protection

The motor is easy to be damaged due to frequent starting and cutting in a short time. When the remaining starting number of the motor is 0 within the set time, the protector sends an alarm signal. If the starting command is issued again at this time, the protector will release and allow to start again after the cooling time.
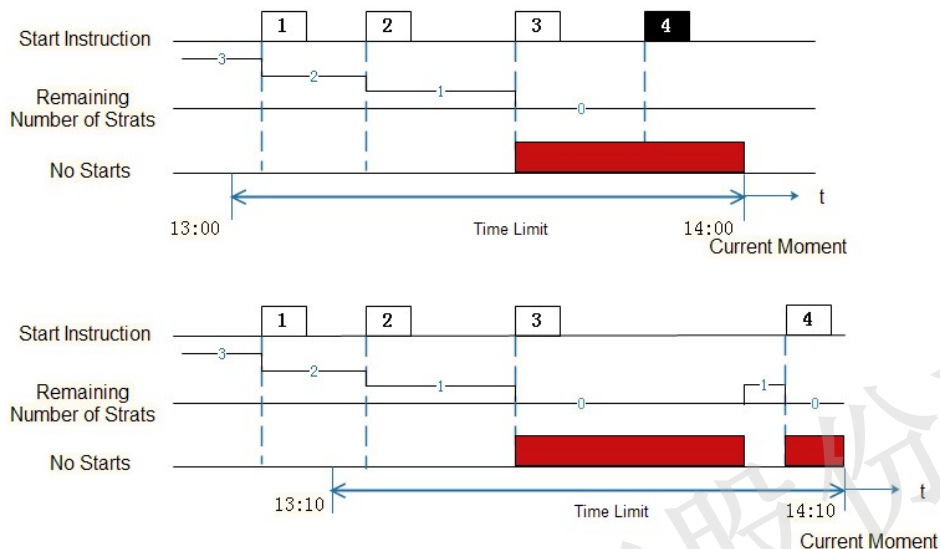

Example: Set the time limit of 1 hour to allow 3 starts.

Figure above: It has been started for 3 times between 13:00 and 14:00, and there is no number of starts at the fourth time, so the fourth time fails.

Figure below: Before the fourth start, the remaining number of starts is restored to 1, so the fourth start is successful.

6.22 Insulation fault protection
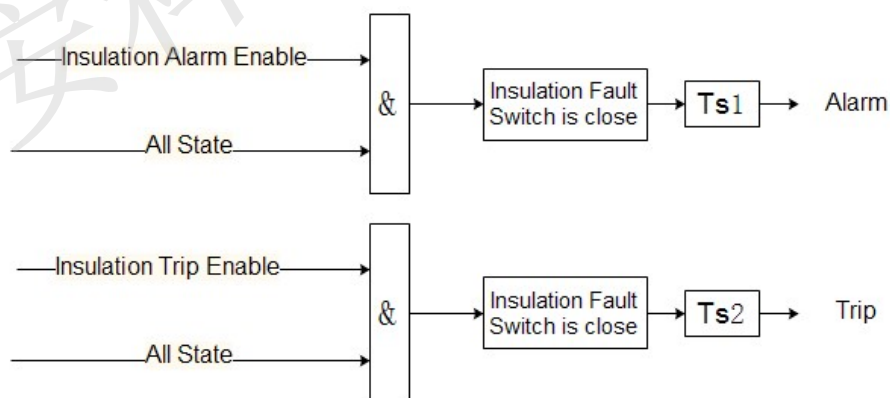

6.23 Running time alarm

When the accumulated running time of the motor exceeds the set value, the protector will send an alarm signal to remind the staff to overhaul and maintain the motor.

6.24 Fault frequency alarm

When the cumulative number of protection trips exceeds the set value, the protector will send an alarm signal.

7、Function setting and description

7.1 Key of main module and LED indicator light are shown in Table 11:

Table 11

Serial No.	Name	State	Function Description
1	Stop LED indicator light	bright	The indicator light indicates that the motor is in a stopped state
2	Start/run indicator light	bright	The indicator light flashes to indicate that the motor is in the starting state, and is always on to indicate that the motor is in the running state
3	Alarm LED indicator light	bright	The light indicates an alarm
4	Trip LED indicator light	bright	This indicator light indicates fault trip
5	Reset button	Press	Use in fault state and restore the fault

7.2 The 60L1 display module button and LED indicator light are shown in Table 12:

Table 12

Serial No.	Name	State	Function Description
1	Start 1 button	Press	Manual mode, two-part mode, two-speed mode, star triangle operation start 1 relay
2	Start 2 button	Press	Operate and start the 2 relay in manual mode and two-speed mode
3	Stop button	Press	Release starting relay
4	Reset button	Press	Restore the fault in tripping state
5	Cancel button	Press	Exit menu;Cancel the operation
6	Left keys	Press	Upside-down menu;Data is shifted when data is modified
7	Right key	Press	Scroll down menu;Modify the data
8	Confirm button	Press	Enter the Settings menu and write the modified data
13	Starting LED indicator light	bright	The indicator lamp is always on to indicate that the motor is in starting state
14	Running LED indicator light	bright	The indicator light is always on to indicate that the motor is in running state
15	Stop LED indicator light	bright	The indicator light is always on to indicate that the motor is in a stopped state
16	Alarm LED indicator light	bright	The light indicates an alarm
17	Trip LED indicator light	bright	This indicator light indicates fault trip

7.3 60L2 display module button and LED indicator light are shown in Table 13:

<div align="center">Table13</div>

Serial Noo	Name	state	Function Description
1	Key 1	Press	Under different display interfaces, the button function of 60L2 panel is not fixed. Users can operate according to the button function instructions in the left display screen.
2	Key 2	Press	
3	Key 3	Press	
4	Key 4	Press	
5	Key 5	Press	
13	Starting LED indicator light	bright	This indicator lamp is always on to indicate that the motor is in starting state
14	Running LED indicator light	bright	The indicator light is always on to indicate that the motor is in running state
15	Stop LED indicator light	bright	The indicator light is always on to indicate that the motor is in a stopped state
16	Alarm LED indicator light	bright	The light indicates an alarm
17	Trip LED indicator light	bright	This indicator light indicates fault trip

Note: When the backlight of 60L1 and 60L2 panel becomes dark, press any button to light up the backlight.

7.4 60L1 display module introduction

7.4.1Data display interface

After the protector is powered on, it enters the data display interface. Press " ◀ " and" ▶ "to scroll through the current, voltage, DI/DO state and other information. The specific display content is shown in Figure 16 (the figure below shows the display value in the stopped state)
FIG.15 60L1 panel data display interface

7.4.2 Parameter viewing and setting

When you need to view or set a parameter, first press "OK" to enter the password interface and enter the correct password (default 0001) before entering the main menu.Press the arrow key to move the cursor to the correspond to option, press the "OK" key to enter, and select the correspond to sub-menu for viewing or modification.Figure 17 shows an example of looking at Ethernet communication Settings:
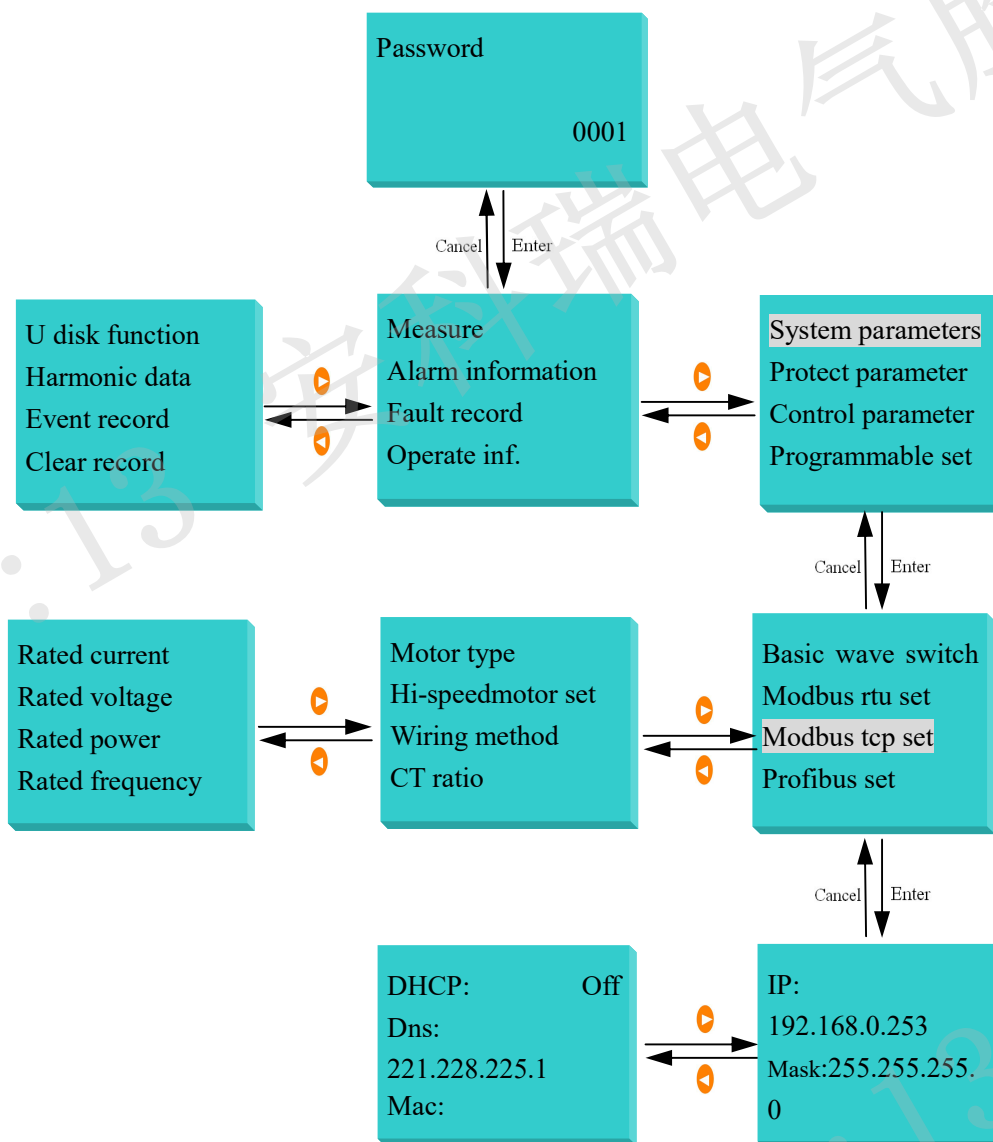

Fig.16 Shows the operation diagram of Ethernet communication parameters

7.5 60L2 Panel Introduction

60L2 interface distribution is shown in Figure 18:
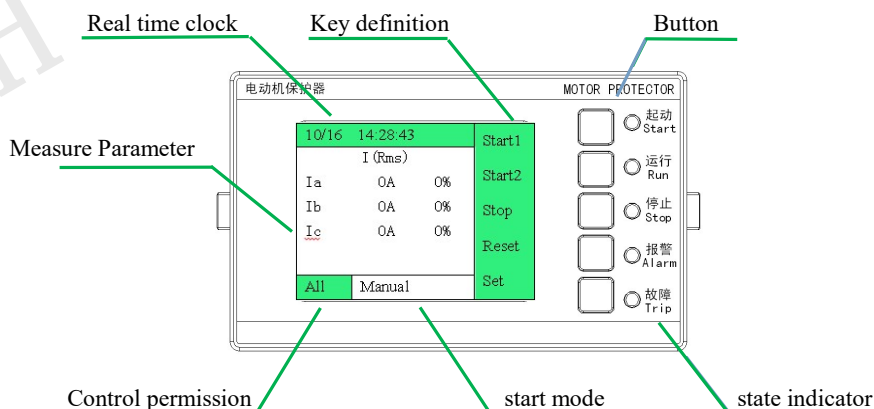

Fig. 17 60L2 panel interface distribution

7.5.1 Data display interface

60L2 panel data display interface automatically switches in the order shown in Figure 18:
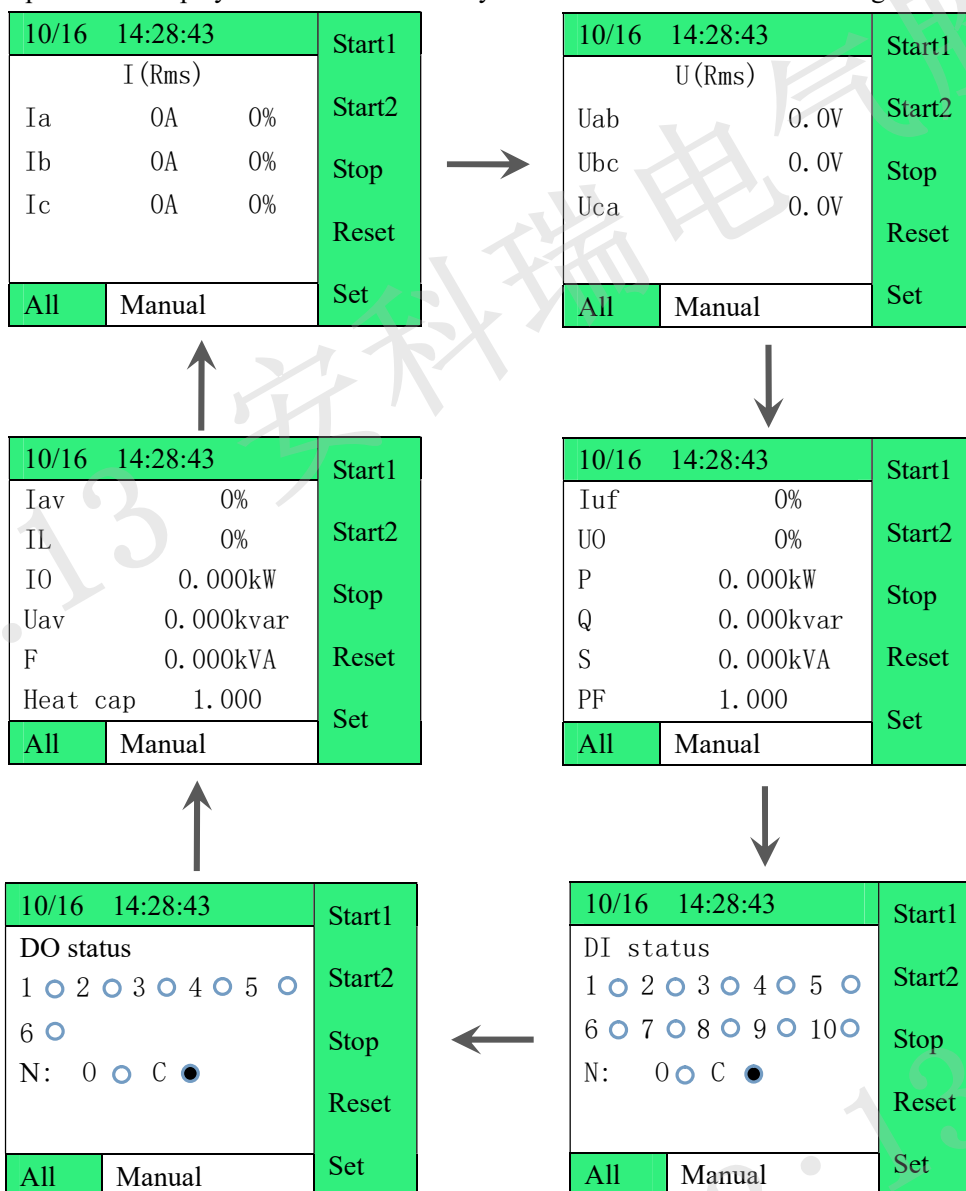

Fig.18 60L2 panel data display interface

7.5.2 Parameter viewing and setting

When viewing or setting a parameter, first press "Set" to enter the password interface according to the instructions in the "Real-time Definition of Keys" bar. After entering the correct password (default 0001), press "OK" to enter the main menu.Press the arrow key to move the cursor to the correspond to option, press the "OK" key to enter, and select the correspond to sub-menu for viewing or modification.Each key has different functions with the menu switching, and users can operate according to the instruction of "Real-time definition of keys" on the left.Figure 19 takes a look at the harmonic data as an example:
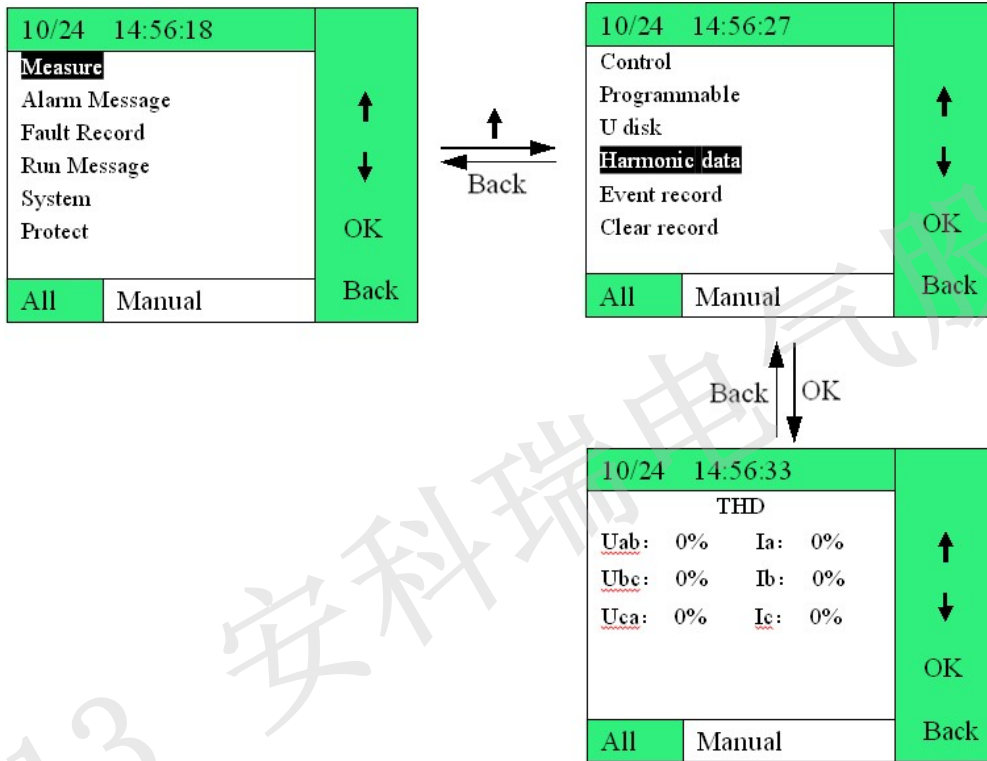

FIG. 19 60L2 panel harmonic data view operation diagram

7.6 Menu description

See Table 14 for the ARD3M menu:

8.Communication Settings and instructions

8.1   Modbus RTUCommunication Protocol Overview

Electrical interface: RS485 half duplex

Baud: 1200/2400/4800/9600/19200/38400

Address: Consists of one byte (8-bit binary), 0 to 255 in decimal, only 1 to 247 in the system, the rest Reserved

Error detection:CRC

Data format:

Address code	Function code	Data area	CRC check

Data length:

1 byte	1 byte	N byte	2 byte

Each byte bit: 1 bit start, 8 bit data (least significant bit sent first), no parity, 1 bit stop

MODBUS function code supported by ARD3M:

01 (0x01) Function code: Read coil state (relay output DO, address 0 correspond tos to DO1)

02 (0x02) Function code: Read switch input state (DI, address 0 correspond tos to DI1)

03/04 (0x03, 0x04) Function code: read hold register

05 (0x05) Function code: write coil state (control relay output DO, address 0 correspond tos to DO1)

06 (0x06) Function code: Write a single register

16 (0x10) function code: Write multiple registers

Note: The operation control bit and output control bit are written in 16 function codes.

Communications applications

The examples in this section use the following tabular format (in hexadecimal data) whenever possible

Addr	Fun	Data start		Data		CRC16	
		reg Hi	reg Lo	reg Hi	reg Lo	Lo	Hi
01H	03H	00H	00H	00H	06H	C5H	C8H
Add	Function code	Data starting address		Data read qty		Cyclic redundancy check code	

Read the data

Example 1: Read register using the 01 function: read the OUTPUT status of DO1-DO5 relay of the 01 ARD3M protector

Check data frame	01 02 00 00 00 05 B8 09
Return data frame	01 02 01 10 A0 44

Example 2: Register read using the 02 function: read the di1-DI5 switch input status of the 01 ARD3M protector

Check data frame	01 01 00 00 00 05 FC 09
Return data frame	01 01 01 0C 51 8D

Example 3: Register read using the 03 or 04 function: read 01 ARD3M and read 3 data from address 00

Check data frame	01 03 00 00 00 03 11 5D
Return data frame	01 03 06 00 00 00 00 00 00 OE D1

Write the data

Example 4: Use the 05 function to write registers

Close DO1 relay no. 01 ARD3M:

Check data frame	01 05 00 00 FF 00 8C 3A
Return data frame	01 05 00 00 FF 00 8C 3A

Disconnect DO1 relay of No. 01 ARD3M:

Check data frame	01 05 00 00 00 00 CD CA
Return data frame	01 05 00 00 00 00 CD CA

Example 5: Write register using 06 function: output DO2 of 01 ARD3M.The indicating register address of switch input/output state is 0013H, bit 0-9 correspond tos to Di1-10, bit 10 correspond tos to DO6, and bit 11-15 correspond tos to DO1-5.

Check data frame	01 06 00 13 10 00 75 CF
Return data frame	01 06 00 13 10 00 75 CF

Example 6: Write register with 16 function: output DO2 of 01 ARD3M.The indicating register address of switch input/output state is 0013H, bit 0-9 correspond tos to Di1-10, bit 10 correspond tos to DO6, and bit 11-15 correspond tos to DO1-5.

Check data frame	01 10 00 13 00 01 02 10 00 A9 33
Return data frame	01 10 00 13 00 01 F0 0C

Description:

03: function code

06: Hexadecimal, decimal number 6, means 6 bytes of data

OE D1: Cyclic redundancy check code

The detailed MODBUS address of ARD3M is shown in table 15 and 16 :(table 15 is the original ARD3 address, which is used for compatibility with the original ARD3 product)

Table 15

Class ificat	Add	Add	Parameter	Read write	Value range	Type

9、 Typical applications

9.1 ARD3M Electrical Motor Protection Mode Wiring
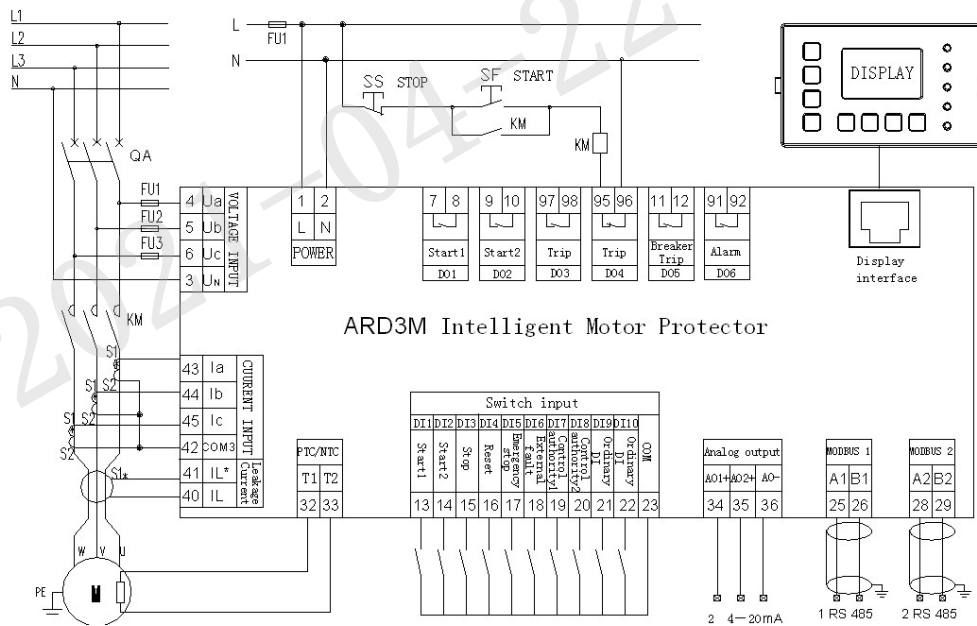

Protection mode: the starting and stopping of the motor is realized by the external button. The closing QA, presses the starting button SF,KM attracts the coil to get electricity, makes the main contact of the KM close, and the motor starts to work. When the stop button is pressed, the KM suction coil loses power, so that the main contact of the KM is released and the motor stops working.

9.2 ARD3M Electrical motor protector direct starting wiring diagram
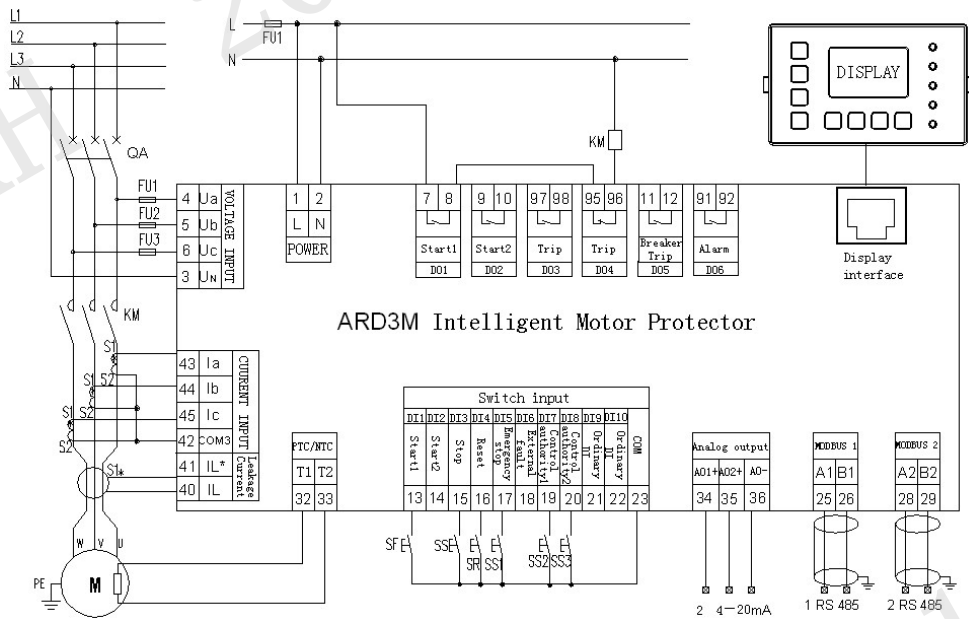

Direct starting: motor starting and stopping is controlled by protector, Press the Start 1 button on the panel, Panel control), DO1 relay (default start 1 function) closed, Close the KM's main contacts, The motor began to work. Press the "Stop" button on the panel, Local control), DO1 relay disconnect, with parking in this mode KM coil is out of power, The motor stopped working. Press switch input DI1(default start 1 function, start control set to manual mode, local control), DO1 relay (default start 1 function) closed, so that the main contact of the KM closed, the motor began to work. Press switch input DI3(default stop function, start control set to manual mode, local control), DO1 relay disconnect 3S,KM coil power loss, motor stop work.

9.3 ARD3M Electrical motor protector forward/reverse (pulse output mode) wiring diagram
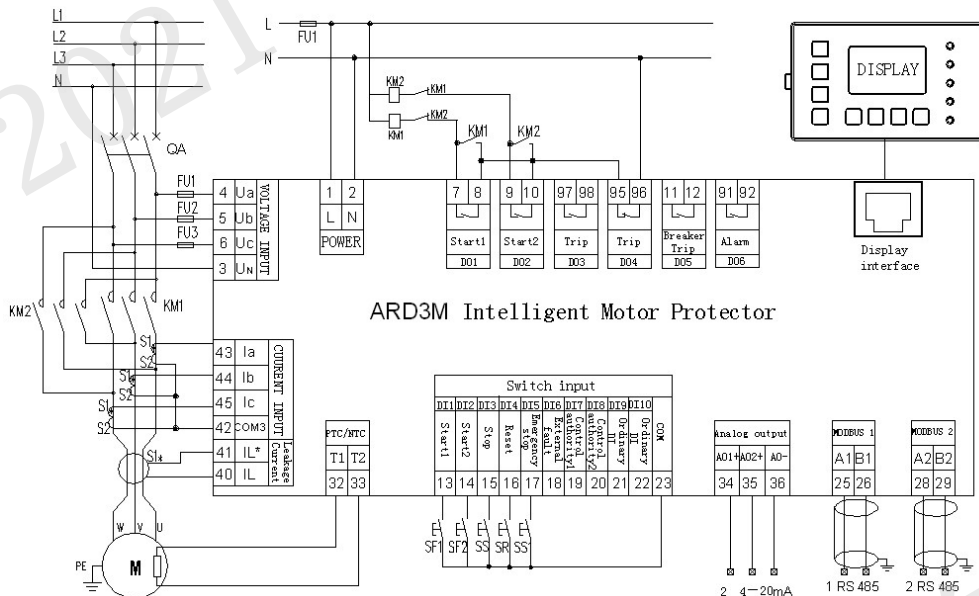

Forward and reverse starting: motor starting and stopping are controlled by protector, Press the Start 1 button on the panel, Panel control), DO1 relay (default start 1 function) closed, Close the KM1's main contacts, Motor starting; Press the "start 2" button on the panel, DO1 relay (default start 1 function) disconnected, DO2 relay (default start 2 function) closed, Close the KM2's main

contacts, Motor reverse start. Press the stop button on the panel, DO2 relay, disconnect, KM1、 KM2 coil is out of power, The motor stopped working.

Click switch input DI1(default start 1 function, Start control set to manual mode, Local control), DO1 relay (default start 1 function) closed, Close the KM1's main contacts, Motor starting; Click switch input DI2(default start 2 function), DO1 relay (default start 1 function) disconnected, DO2 relay (default start 2 function) closed, Close the KM2's main contacts, Motor reverse start. Click switch input DI3(default stop function), DO2 relay disconnected, KM1、KM2 coil is out of power, The motor stopped working.

9.4 ARD3M Electrical Motor Protector Y-△ Starting (Two Relay Mode) Wiring Diagram
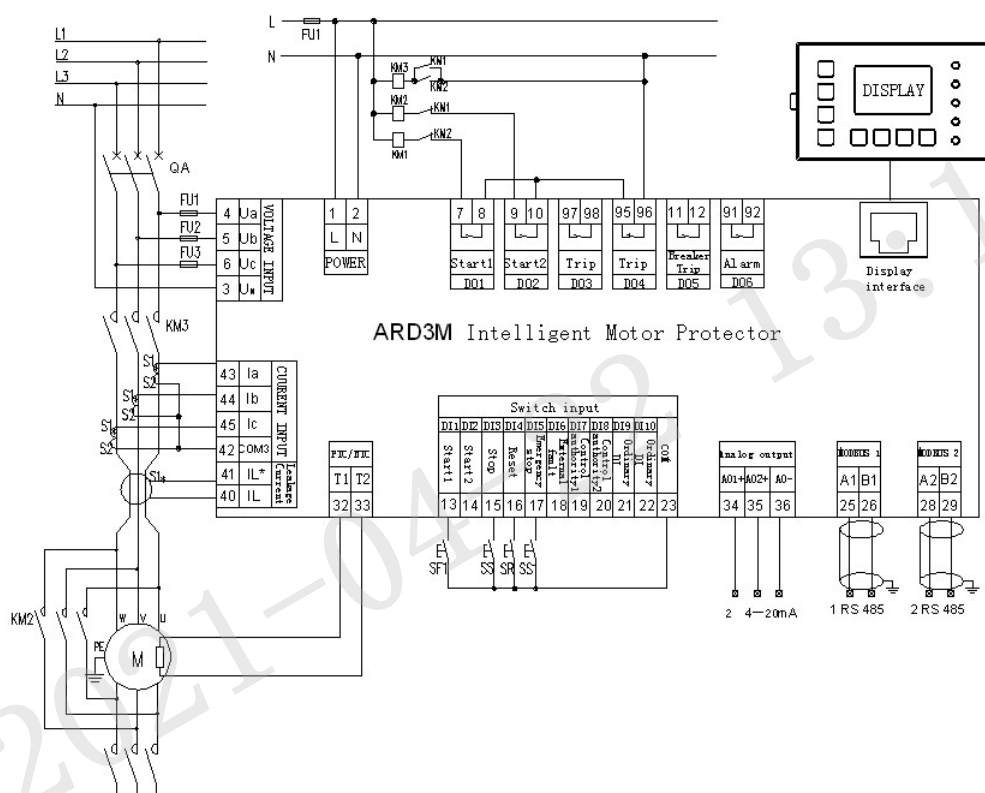

Y-△ start (two relay mode): motor start, stop is controlled by protector, Press the "Start 1" button on the panel, Panel control), DO1 relay (default start 1 function) closed, Close the KM1、KM3's main contacts, Motor Y starting, After conversion time DO1 relay disconnected, DO2 relay closed (default start 2 function), Close the KM2、KM3's main contacts, Motor into △ operation. Press the stop button on the panel, DO2 relay (default start 2 function) disconnected, KM1、KM2、 KM3 coil is out of power, The motor stopped working.

Click switch input DI1(default start 1 function, Starting control is set to two-step mode, Local control), DO1 relay (default start 1 function) closed, Close the KM1、KM3's main contacts, Y motor starts, After conversion time DO1 relay disconnected, DO2 relay closed (default start 2 function), Close the KM2、KM3's main contacts, Motor into △ operation. Click switch input DI3(default stop function), DO2 relay (default start 2 function) disconnected, KM1、KM2、 KM3 coil is out of power, The motor stopped working.

9.5 ARD3M Electrical Protector Y-△ Starting (Three Relay Mode) Wiring Diagram
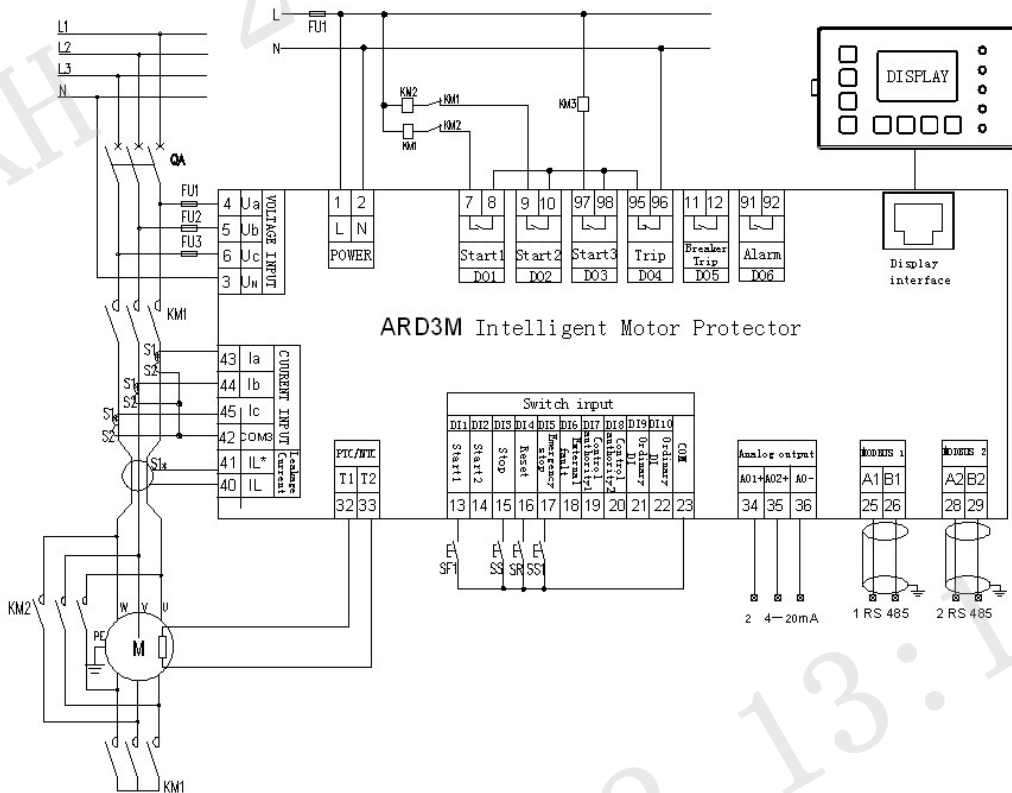

Y-△ start (three relay mode): motor start, stop is controlled by protector, Press the "Start 1" button on the panel, Panel control), DO1 relay (default start 1 function), DO5 relay (default start 3 function) closed, Close the KM1、KM3's main contacts, Motor Y starting, After the switch time DO1 the relay is disconnected, DO2 relay closed (default start 2 function), Close the KM2、KM3's main contacts, Motor into △ operation. Press the stop button on the panel, DO2 relay (default start 2 function), DO5 relay (default start 3 function) disconnected, KM1、KM2、KM3 coil is out of power, The motor stopped working.

Click switch input DI1(default start 1 function, Starting control is set to two-step mode, enabling local control), DO1 relay (default start 1 function), DO5 relay (default start 3 function) closed, Close the KM1、KM3's main contacts, Y motor starts, After the switch time DO1 the relay is disconnected, DO2 relay closed (default start 2 function), Close the KM2、KM3's main contacts, Motor into △ operation. Press the stop button, DO2 relay (default start 2 function), DO5 relay (default start 3 function) disconnected, KM1、KM2、KM3 coil is out of power, The motor stopped working.

9.6 ARD3M Electrical Motor Protector Double Speed Mode Connection
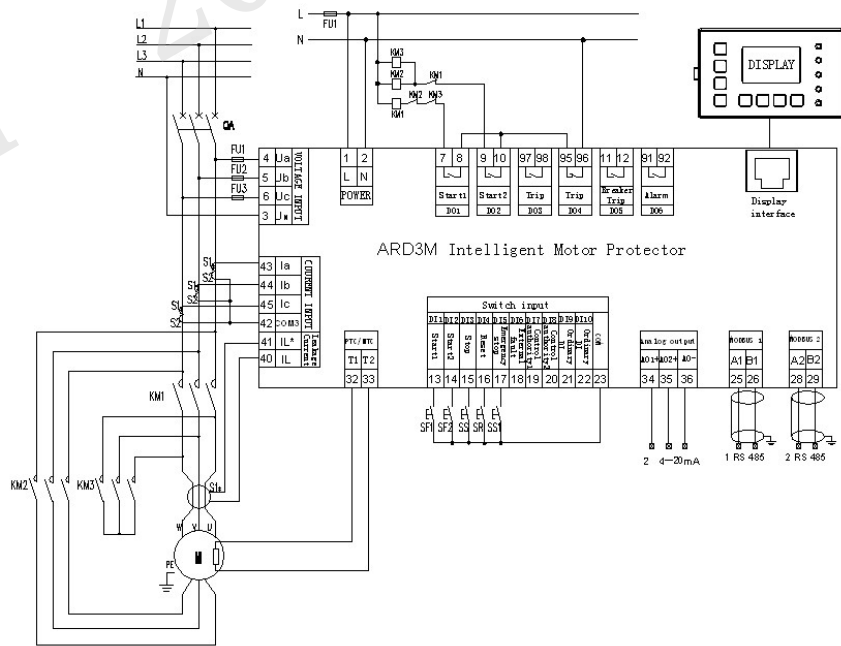

Double speed starting: motor starting and stopping are controlled by protector, Press the "Start 1" button on the panel, Panel control), DO1 relay (default start 1 function) closed, Close the KM1's main contacts, Motor starting at low speed; Press the start 2 button, DO1 relay (default start 1 function) disconnected, DO2 relay (default start 2 function) closed, Close the KM2、KM3's main contacts, Motor starting at high speed. Press the stop button on the panel, DO2 relay (default start 2 function) disconnected, KM2、KM3 coil is out of power, The motor stopped working.

Click switch input DI1(default start 1 function, Starting control is set to double speed mode, Local control), DO1 relay (default start 1 function) closed, Close the KM1's main contacts, Motor starting at low speed; Click switch input DI2(default start 2 function), DO1 relay (default start 1 function) disconnected, DO2 relay closed (default start 2 function), Close the KM2、KM3's main contacts, Motor starting at high speed. Click switch input DI3(default stop function), DO2 relay (default start 2 function) disconnected, KM2、KM3 coil is out of power, The motor stopped working.
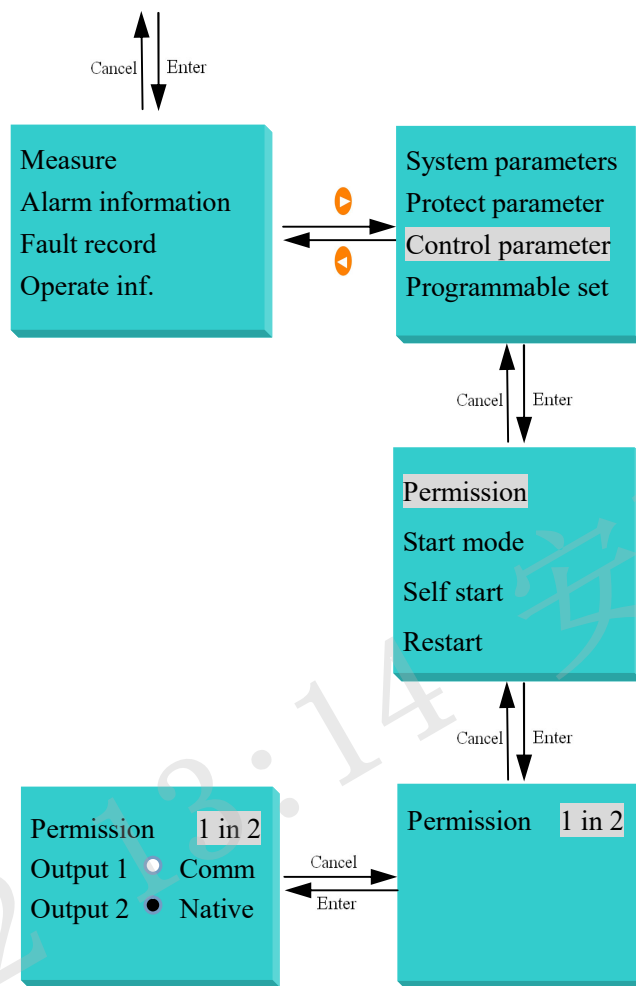

10、 Features and Functions

10.1 Permissions programmable

Protector has perfect control authority programmable function, with permission for "1 in 2" or "1 in 3" use.

When the control permission is "1 in 2 ", the user can define the control permission output 1 and output 2: either of the panel, communication native, remote and parking (both definitions are not repeatable).The specific steps are as follows:

Password

0001

Cancel | Enter

Measure	System parameters
Alarm information	Protect parameter
Fault record	Control parameter
Operate inf.	Programmable set

Cancel | Enter

Permission
Start mode
Self start
Restart

Cancel | Enter

Permission 1 in 2	Permission 1 in 2
Output 1 ○ Comm	
Output 2 ● Native	

Cancel / Enter

For example, control permissions are defined as "1 in 2 ", control permission output type output 1 is defined as" communication control ", output 2 is defined as "remote control ". The DI7 is defined as control permission 1. When DI7(control permission 1) is disconnected, the control mode correspond to to the control permission output 1 takes effect, and the control mode correspond to to the output 2 takes effect when the DI7(control permission 1) is connected. The control permissions are selected as shown in Table 17 below:

Table 17

Control Permission Output Type	DI7 Control Permission Input 1 State
Output1——Communication control	0
Output2——Native control	1

When the control permissions are set to "1 in 3", The user can define control rights output 1, output 2, output 3, and output 4 as either of the panel, communication native, remote, and parking, respectively (each output definition is not repeatable), The effective output is selected by DI7(control permission 1), DI8(control permission 2) on-off. If control permission output 1 is defined as communication control, Output 2 is defined as "native" control, Output 3 is defined as "panel" control, Output 4 is defined as "remote" control, The control permissions are selected as shown in Table 18 below:

Table 18

Control permissions	DI Input state	
	DI7 Control permission 1	DI8 Control permission 2
Communication control	0	0
Native control	0	1
Panel control	1	0
Remote control	1	1

Note :"0" means switch input disconnected ,"1" means turn on

10.2 Logic programmable

The protector has logic programmable function, and the user can program and define according to the required logic output function. Each logic function consists of five programmable input conditions A、B、C、D、E, freely combined by "with "," or" relations. The programmable content of each input condition and the combination of input conditions can be seen in Table 11 menu.

Suppose the user needs to output passive signal when any fault occurs in blocking, short circuit, time limit overload, phase break, current imbalance, can set DO3(or other DO) to logic diagram output 1, set the condition of logic output 1 to A*B*C*D*E, and set the condition input A、B、C、D、E to block, short circuit, time limit overload, phase break, current imbalance fault, then block, short circuit, time limit overload, phase break, current imbalance fault any fault occurs, DO3——logic diagram output 1 action, output passive signal.

Note :"+" representation and logic ," * " representation or logic.

10.3 Custom communication address

The protector has the function of customizing communication address, which makes communication reading more convenient and effective.

There are 120 communication addresses for user customization. Address 5000-5119 and 5300-5419, the correspond to data values can be customized. If the value of 5300 is written as 2010, the address 5000 is the same as the address 2010 data.

Example: Suppose the user needs to read and write the original address 2003,2300,2307,2309,2335,2357,2758,2800 frequently. These addresses are not continuous addresses, each read an address data, need to send a MODBUS read command.

In this case, the efficiency can be improved by customizing the address function: the user can write the address 5300-5307 as 2003,2300,2307,2309,2335,2357,2758,2800 respectively, so that the definition of the address 5000-5007, read and write, value range and so on will correspond to to the above address one by one. At this time, the user only needs to send a read command to achieve all data read and write.

11、 Examples of ordering

Example: specific model: ARD3M K1-100/H M1SR-60L1

Technical requirements: motor power 37 KW,1 4-20 mA analog output ,2-63 current, voltage harmonic measurement; with fault record

Communication protocol :2 channels RS485 protocol, MODBUS RTU protocol

Auxiliary power: AC 220V

Display mode :60 L1(black and white LCD)

Note: main body and transformer connection length 1m; main body and panel connection length 1.5 m.
